## Background:

Developing countries have been peasant societies. The cities in traditional societies have been pilgrimage centers, seats of administration and educational centers. These cities had homogeneous relationships with the villages. Industrialization has developed modern megacities whose way of life is heterogeneous with that in the villages. Rural poverty has pushed villagers to the cities, which were never planned to accommodate immigrants. Public health and social problems have arisen lowering the quality of life. Communicable diseases among the urban poor coexist with non-communicable diseases among the comparatively affluent. Problems of pollution, crime and chronic morbidity increase. The NGOs provide relief to the poor and needy but do nothing toward creating an infrastructure for balanced development. The election of women as a result of non-discriminatory legislation provides good ground for hope.

Urbanization can lead to several health problems, including:

- Non communicable diseases like heart disease, asthma, cancer and diabetes, which are made worse by unhealthy living and working conditions, inadequate green space, pollution such as noise, water and soil contamination, urban heat islands and a lack of space for walking, cycling and active living.
- Poor nutrition
- Pollution-related health conditions and communicable diseases
- Poor sanitation and housing conditions, and related health conditions. These have direct impacts on individual quality of life, while straining public health systems and resources.
